

1770-206US FC

oligonucleotide consisting essentially of arabinose sugars substituted at 2' position of the sugar ring with halogen, alkyl, alkylhalide, alkylsulfhydryl, allyl, amino, aryl, alkoxy, or azido and hybridizing to duplex DNA/DNA or DNA/RNA to form a triple helical complex, in association with an acceptable carrier.

2. (Amended) The composition of claim 1, wherein said oligonucleotide has the formula:

wherein,

B is selected from the group consisting of adenine, guanine, uracil, thymine, cytosine, inosine, and 5-methylcytosine;

Y at the 2' position of the sugar ring is selected from the group consisting of a halogen (fluorine, chlorine, bromine, iodine), [hydroxyl,] alkyl, alkylhalide (e.g., $-\text{CH}_2\text{F}$), alkylsulfhydryl ($-\text{SCH}_3$), allyl, amino, aryl, alkoxy, and azido;

R at the internucleotide phosphate linkage is selected from the group consisting of oxygen, sulfur, methyl, amino, alkylamino, dialkylamino (the alkyl group having one to about 20 carbon atoms), methoxy, and ethoxy; and

1770-206US FC

X at the furanose ring (position 4') is selected from the group consisting of oxygen, sulfur, and methylene (CH₂).

4. (Amended) The composition of claim 1 [or 2], wherein said RNA is complementary RNA.

6. (Amended) The composition of claim[s] 1[-5], wherein said acceptable carrier is a pharmaceutically acceptable carrier for administration to a host.

8. (Amended) A method to inhibit DNA replication and/or DNA transcription, which comprises hybridizing in a sequence specific manner an oligonucleotide consisting essentially of arabinose sugars substituted at 2' position of the sugar ring with halogen, alkyl, alkylhalide, alkylsulfhydryl, allyl, amino, aryl, alkoxy, or azido to duplex DNA/DNA or DNA/RNA to form a triple helical complex; thereby inhibiting DNA replication and/or DNA transcription.

9. (Amended) The method of claim 7 [or 8], wherein said oligonucleotide has the formula:

1770-206US FC

wherein;

B is selected from the group consisting of adenine, guanine, uracil, thymine, cytosine, inosine, and 5-methylcytosine;

Y at the 2' position of the sugar ring is selected from the group consisting of a halogen (fluorine, chlorine, bromine, iodine), [hydroxyl,] alkyl, alkylhalide (e.g., $-\text{CH}_2\text{F}$), alkylsulfhydryl ($-\text{SCH}_3$), allyl, amino, aryl, alkoxy, and azido;

R at the internucleotide phosphate linkage is selected from the group consisting of oxygen, sulfur, methyl, amino, alkylamino, dialkylamino (the alkyl group having one to about 20 carbon atoms), methoxy, and ethoxy; and

X at the furanose ring (position 4') is selected from the group consisting of oxygen, sulfur, and methylene (CH_2).

10. (Amended) The method of claim 7 [or 8], wherein said oligonucleotide is

wherein,

B is selected from the group consisting of adenine, guanine, uracil, thymine, cytosine, inosine, 5-methylcytosine;

1770-206US FC

Y at the internucleotide phosphate linkage is selected from the group consisting of oxygen, sulfur, methyl, amino, alkylamino, dialkylamino (the alkyl group having one to about 20 carbon atoms), methoxy, and ethoxy; and

X at the furanose ring (position 4') is selected from the group consisting of oxygen, sulfur, and methylene (CH₂).

11. (Amended) The method of claim 7 [or 8] wherein said oligonucleotide is chemically modified at least at one site with a ligand or a pharmacological agent to enhance at least one of: (i) permeability of said oligonucleotide into cells, (ii) nuclease stability, or (iii) binding strength of hybridization to complementary sequences.

16. (Amended) A method of catalyzing chemical reactions carried out by [DNA] nucleic acid enzymes, which comprises using the composition of claim 2.

17. (Amended) The method of claim 7 [or 8] wherein said oligonucleotide is a chimera of at least one ANA [oligo]nucleotide unit and at least one 2'F ANA [oligo]nucleotide unit to enhance at least one of: (i) permeability of said oligonucleotide into cells, (ii) nuclease stability, or (iii) binding strength of hybridization to complementary sequences.

18. (Amended) An oligonucleotide for selectively preventing gene transcription and expression in a sequence-specific manner in a host; which comprises an oligonucleotide consisting essentially of arabinose sugars hybridizing to a single stranded RNA to induce RNase H activity; an oligonucleotide consisting essentially of arabinose sugars substituted at 2' position of the sugar ring with halogen, alkyl, alkylhalide, alkylsulfhydryl, allyl, amino, aryl, alkoxy, or azido and hybridizing to duplex DNA/DNA or

1770-206US FC

DNA/RNA to form a triple helical complex; and at least one 2-O-methyl-D-ribose sugar at 3', 5' or both terminus of said oligonucleotide.

19. (Amended) The oligonucleotide of claim 18, wherein said oligonucleotide has the formula:

wherein,

B is selected from the group consisting of adenine, guanine, uracil, thymine, cytosine, inosine, and 5-methylcytosine;

Y at the 2' position of the sugar ring is selected from the group consisting of a halogen (fluorine, chlorine, bromine, iodine), [hydroxyl,] alkyl, alkylhalide (e.g., -CH₂F), alkylsulfhydryl (-SCH₃), allyl, amino, aryl, alkoxy, and azido;

R at the internucleotide phosphate linkage is selected from the group consisting of oxygen, sulfur, methyl, amino, alkylamino, dialkylamino (the alkyl group having one to about 20 carbon atoms), methoxy, and ethoxy; and

X at the furanose ring (position 4') is selected from the group consisting of oxygen, sulfur, and methylene (CH₂).
